Claim 8. (Currently amended) A processor to perform a method of providing a single electronic mail file containing electronic mail data and variable meta data, the method encoding electronic mail comprising:

combining into a single electronic mail file the electronic mail data and the variable meta-data information, wherein the variable meta-data describesing the electronic mail data;

monitoring changes to the variable meta-data information with a header wherein the header operates as an encoder and monitors changes to the variable

meta-data information, the header additionally monitoring location information identifying the position of the electronic mail data within the electronic mail file; and
recompute the variable meta-data information;
attempt delivery of the electronic mail file;
rewrite the variable meta-data information;
change location information contained within the header; and
send the electronic mail file to a receiving computer.
~~monitoring a location of the electronic mail data within the electronic mail file with the header.~~

Claim 10. (Currently amended) The method of claim 8, wherein the variable meta-data information is referenced in the header.

Claim 13. (Currently amended) A ~~tangible~~ computer readable storage medium having computer readable instructions encoded therein to:
accept an electronic mail connection;
receive a single electronic mail file comprising electronic mail data combined with meta-data information describing the electronic mail data, the single electronic mail file further comprising a header which operates as an encoder and monitors changes to the variable meta-data information, the header additionally monitoring location information identifying the position of the

~~electronic mail data within the electronic mail file with links to the meta-data information and a location of the electronic mail data;~~
record the electronic mail data;
compute and record the variable meta-data information;
compute and record ~~links~~ the location information contained within the header;
and
~~pass~~ send the electronic mail file containing the electronic mail data and the variable meta-data information to a receiving computer for processing.

sending the SMTP commands to the at least one receiving computer; and

~~sending receiving SMTP~~ replies from the at least one receiving computer to
on the sending computers;

sending the single electronic mail file from the sending computer to the receiving
computer, wherein the single electronic mail file includes combined electronic
mail data and variable meta-data information describing the electronic mail
data, and a header which operates as an encoder and monitors changes to
the variable meta-data information, the header additionally monitoring location
information identifying the position of the electronic mail data within the
electronic mail file ~~containing links to the meta-data information and to a~~

Reasons for allowance

3. The following is an examiner's statement of reasons for allowance:

Applicant's claimed invention distinguished over the prior art for the following reasons. The claims are allowable over the prior art of record because none of the references, either alone or in combination, discloses or renders obvious the method for combining the meta data of the email and the files that represent the email data into a single file and encoding a header for monitoring the changes to the meta-data and the location of the actual data within the file. Furthermore, the limitation of "computer readable storage medium", which is disclosed in the claims, only refers to hardware storage medium.
